Total Score: 100
(10) 1. Use the integral test to determine whether the following series converges or diverges. (The right answer is worth 2 points. Showing work is worth 8 points.)

\[
\sum_{n=2}^{\infty} \frac{1}{n\sqrt{\ln(n)}}
\]

\[
= \lim_{t \to \infty} \int_{2}^{t} \frac{dx}{x\sqrt{\ln(x)}} = \lim_{t \to \infty} \int_{2}^{t} \frac{du}{u^{1/2}}
\]

\[
= \lim_{t \to \infty} \left[ 2u^{1/2} \right]_{2}^{t} = \lim_{t \to \infty} \left( 2\sqrt{\ln(t)} - 2\sqrt{\ln(2)} \right) = \infty, \quad \text{since } \ln(t) \to \infty \text{ as } t \to \infty.
\]

Since integral diverges, so does the series.

(You might also note that the function \( f(x) = \frac{1}{x\sqrt{\ln(x)}} \) is decreasing, so the integral test applies.)

(8) 2. Use the limit comparison test to determine whether the following series converges or diverges. (The answer is worth 2 points, showing work 6 points.)

\[
\sum_{n=1}^{\infty} \frac{n^2 + 7}{3n^5 - n^2}
\]

Compare \( \sum_{n=1}^{\infty} \frac{n^2}{3n^5} = \sum_{n=1}^{\infty} \frac{1}{3n^3} = \frac{1}{3} \sum_{n=1}^{\infty} \frac{1}{n^3} \)

Note, the latter series is a \( p \)-series with \( p = 3 > 1 \), so it converges.

Apply limit comparison test:

\[
\lim_{n \to \infty} \frac{n^2 + 7}{3n^5 - n^2} \cdot \frac{3n^3}{n^2} = \lim_{n \to \infty} \frac{3(n^2 + 7n)}{3n^3 - 1}
\]

\[
= \lim_{n \to \infty} \frac{3(1 + \frac{7n}{n^2})}{3 - \frac{1}{n^3}} = \lim_{n \to \infty} \frac{3}{3} = 1
\]

Since the limit is a positive real number, the two series have the same behavior. Thus the original series converges.
3. Determine whether the following series converge or diverge. State clearly which test you are using and implement the test as clearly as you can. (The answer for each problem is worth 2 points and the work you show 4 points.)

(6) a) \[ \sum_{n=1}^{\infty} \frac{1}{\sqrt{n}} = \sum_{n=1}^{\infty} \frac{1}{n^{1/2}}, \text{ a p-series with } p = \frac{1}{2} < 1, \text{ so the series diverges.} \]

(6) b) \[ \sum_{n=1}^{\infty} \cos(1/n) \]
\[ \lim_{n \to \infty} \cos\left(\frac{1}{n}\right) = \cos(0) = 1 \neq 0 \]
Thus, the series diverges by divergence test.

(6) c) \[ \sum_{n=1}^{\infty} \left(\frac{n}{2n+3}\right)^n \]
Use root test:
\[ L = \lim_{n \to \infty} \left[ \left( \frac{n}{2n+3} \right)^n \right]^{1/n} = \lim_{n \to \infty} \frac{n}{2n+3} \cdot \frac{1}{n} \]
\[ = \lim_{n \to \infty} \frac{1}{2 + \frac{3}{n}} = \frac{1}{2} < 1 \]
Thus, by root test, the series converges.
4. Let \( S = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{2n-1} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \cdots \), and \( S_n \) denote the \( n \)-th partial sum. How many terms are required so that the error \( |S - S_n| \) is less than .01, where \( S_n \) denotes the \( n \)-th partial sum?

\[
\text{Need } A_{n+1} < .001, \quad \frac{1}{2n+1} < \frac{1}{100}, \quad \frac{1}{2n} < \frac{1}{100}
\]

\( \Rightarrow 2n+1 > 100, \quad 2n > 99 \), \( n > 99/2 = 49.5 \)

Thus \( n = 50 \) is the minimal number of terms needed.

5. Determine whether the following series converge conditionally, converge absolutely, or diverge. (The answer is worth 2 points, the work 4 points.)

(6) a) \( \sum_{n=2}^{\infty} \frac{\cos(n)}{n^{3/2}} \)

\[
\sum_{n=2}^{\infty} \frac{\cos(n)}{n^{3/2}} \leq \sum_{n=2}^{\infty} \frac{1}{n^{3/2}} < \infty \]

since the latter series is a \( p \)-series with \( p = \frac{3}{2} > 1 \).

Thus, by direct comparison test, the original series converges absolutely.

(6) b) \( \sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n}} \)

\[
\sum_{n=1}^{\infty} \left| \frac{(-1)^n}{\sqrt{n}} \right| = \sum_{n=1}^{\infty} \frac{1}{\sqrt{n}} = \infty \]

\( \text{(diverges)} \)

The given series is an alternating series with terms satisfying \( \lim_{n \to \infty} \frac{1}{\sqrt{n}} = 0 \), \( \frac{1}{2} \sqrt{n} \) is a decreasing sequence.

Thus, by Alternating Series test, the given series converges.

Therefore, the series converges conditionally.
(10) 6. Find the interval of convergence of the power series \( \sum_{n=1}^{\infty} \frac{(x-3)^n}{n \cdot 3^n} \). (Make sure to acknowledge any endpoints.)

Start with the ratio test:

\[
\rho = \lim_{n \to \infty} \left| \frac{(x-3)^{n+1} \cdot n \cdot 3^n}{(x-3)^n \cdot (n+1) \cdot 3^{n+1}} \right| = \frac{|x-3|}{3} \lim_{n \to \infty} \frac{n}{n+1} = \frac{|x-3|}{3} \]

\( \rho < 1 \iff \frac{|x-3|}{3} < 1 \iff |x-3| < 3 \quad \frac{3}{3} = 1 \)

Next, test the endpoints:

At \( x = 0 \) \( \sum_{n=1}^{\infty} \frac{(-1)^n}{n \cdot 3^n} = -\sum_{n=1}^{\infty} \frac{(-1)^n}{n} \) converges by the Alternating Series Test, since \( \frac{1}{n} \) decreases to 0.

\( x = 6 \) \( \sum_{n=1}^{\infty} \frac{3^n}{n \cdot 3^n} = \sum_{n=1}^{\infty} \frac{1}{n} = \infty \), harmonic series.

Thus, interval of convergence is \( [0, 6) \).

(5) 7. a) Use sigma notation to write down the general formula for the Taylor series of \( f(x) \) centered at \( x = c \).

\[
\sum_{n=0}^{\infty} \frac{f^{(n)}(c)}{n!} (x-c)^n
\]

(5) 7. b) Apply the formula in part (a) to find the Maclaurin series \( (c = 0) \) for \( f(x) = e^{2x} \). (Start by finding the \( n \)-th derivative of \( f(x) \).)

\( f'(x) = 2e^{2x} \quad \text{Thus} \quad f^{(m)}(0) = 2^n e^0 = \frac{2^n}{n} \quad \text{for} \quad n \in \mathbb{N}_{0}, 1, 2, 3, \ldots \)

\( f''(x) = 4e^{2x} \)

\( f^{(n)}(x) = 2^n e^{2x} \)

\( \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = \sum_{n=0}^{\infty} \frac{2^n}{n!} x^n \)

(Valid for all \( x \in \mathbb{R} \))
(6) 8. Given \(\ln(1+x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}x^n}{n} = x - \frac{x^2}{2} + \frac{x^3}{3} \cdots\), find the terms up to \(x^5\) in the Maclaurin series for \(\ln(1+x^2)\).
\[
\left(x^2 - \frac{x^4}{2} + \cdots\right) \left(x - \frac{x^3}{6} + \frac{x^5}{120} \cdots\right)
\]
\[
= x^3 - \frac{x^5}{6} + \frac{x^7}{2} + \cdots
\]

8. \[\ln(1+x^2) = x^3 - \frac{x^5}{6} + \frac{x^7}{2} + \cdots + \text{higher degree terms}\]

(6) 9. a) Sketch the graph of the curve given by the parametric equations \(x = 2\sin t, y = \cos t, 0 \leq t \leq 2\pi\). Indicate the starting point \((t = 0)\) and place an arrow to indicate the direction traveled.

## Graph

(6) b) Eliminate the parameter \(t\) to express the curve in part a) as an equation in terms of \(x\) and \(y\).

\[
\left(\frac{x}{2}\right)^2 + y^2 = \sin^2 t + \cos^2 t = 1
\]

\[
\frac{x^2}{2^2} + y^2 = 1
\]

(8) 10. A curve is given by the parametric equations \(x = 2t - \sin t, y = 1 - \cos t\). Find the slope \(dy/dx\) of the curve at \(t = \frac{\pi}{2}\).

\[
\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\sin(t)}{2 - \cos(t)}
\]

\[
\frac{dy}{dx} \bigg|_{t=\pi/2} = \frac{1}{2 - 0} = \frac{1}{2}
\]
